

Blocking Solutions

The selection of Blocking agents is very important in ELISA and WB. We have developed optimized Ready-to-Use blocking solutions with various characteristics.

Please try our blocking solutions if you use Skim milk for WB, or if you need storage of pre-coated ELISA plates.

【Product Feature】

1. Ready-to-Use
2. Optimized for WB or ELISA
3. For WB, stronger signal can be obtained by using Skim milk*
4. For ELISA, pre-coated plate can be stored for months**

*:based on experiment in our laboratory, **:except that antibody or antigen can not stored for long time.

【Product Outline】

c-Block: 100% chemical components. Good for WB and antibody-detecting ELISA.

h-Block: Casein-based. Good for many applications.

k-Block: Denatured casein-based. Shows stable results in many applications.

b-Block: BSA-based. Good for many applications.

Trial set: Composed of all the above 4 solutions. Good for screening the best blocking solution.

【Product lineup】

Field	Product #	Product name	content
Western	BCL-BKCW-01	c-Block-w	500 mL
	BCL-BKHW-01	h-Block-w	500 mL
	BCL-BKKW-01	k-Block-w	500 mL
	BCL-BKBW-01	b-Block-w	500 mL
	BCL-BKSW-01	Blocking solution Trial set (Western)	20 mL×4
ELISA	BCL-BKCE-01	c-Block-e	500 mL
	BCL-BKHE-01	h-Block-e	500 mL
	BCL-BKKE-01	k-Block-e	500 mL
	BCL-BKBE-01	b-Block-e	500 mL
	BCL-BKSE-01	Blocking solution Trial set (ELISA)	20 mL×4

【Related Products】

Product #	Product name	content	Outline
BCL-SBN-02	Signal Booster Neo 250	250 mL	Protein-free antigen-antibody reaction enhancer
BCL-125	Signal Booster	250 mL set	Standard antigen-antibody reaction enhancer

Different sizes are available for Signal Booster and Signal Booster Neo.

Experimental examples

(Though not indicated each specified blocking solutions were used for WB and ELISA.)

Example 1. comparison of blocking solutions

Example 2. Detection of phospho-protein with c-Block and Signal Booster Neo

Example 3. Detection of Ephrin type-A receptor2

Example 4. Antigen-detecting sandwich ELISA

Example 5. Antibody-detecting ELISA

Capture Ag: Filaria antigen
Blocking: as indicated (Dried plates were stored for 3 days.)
Antibody sample: infected serum
Detection: MAD reagent (HRP) in SB.

Example 6. Stability of pre-coated plate

Explanation of abbreviation

SB: Signal Booster
SBN: Signal Booster Neo
Product.S: well-known plate preservative

Selection of Blocking Solutions

A general rule of selection for Blocking Solution is described. We strongly recommend to select the best one by screening using Trila Set.

Western Blot: Many reserachers seems to use Skim milk. Skim milk is not bad choice, but it very often gives you weak signal due to its strong blocking action. Below is the recommended use of our bloking solutions.

- ①To get higher signal(accept some background increase):
- ②To reduce background(accept some decrease of signal):
- ③To use as a standard blocking:
- ④To detect phospho-protein:

k-Block, c-Block
b-Block, h-Block
h-Block, b-Block
c-Block, b-Block

- Use c-Block when avoiding protein contamination in an assay system.
- To increase signals, use Signal Booster or Signal Booster Neo.

ELISA: Below shows choice of blocking solutions depending on the ELISA system you use. All the solutions for ELISA are desinged for long term preservation, and dried precoated plate can be stored for a few months after blocking at 4°C.

Antigen-detecting ELISA: Direct method (detect antigen adsorbed on plate by detecting antibody):
Antibody-sandwich method (detect antigen by captured antibody by detect antibody):
Antibody-detecting ELISA: Direct method (detect antibody captured by pre-coated antigen):
Antigen-sandwich method (detect antibody by captured antigen by detect antigen):

c-Block, b-Block, k-Block
k-Block, b-Block, h-Block
c-Block, b-Block, k-Block
